ABSTRACT

Vegetables are the prime source of vitamins and minerals. As the population increases there is also increase in demand for nutritional vegetables, but in the conventional method of horticulture the production and productivity is considerably less. Thus to increase the productivity and to feed the over burgeoning population there is a need for novel fertilizers such as Nano fertilizers. An experiment was hence conducted in Chinapettai village, Panruti to investigate the Bio-efficacy of Nano nutrients (Nano Nitrogen, Zinc and Copper) on growth and yield of Capsicum. The experiment was carried out in RBD design (Randomized block design) with three replications and ten treatments. Results showed that the treatment with 100% RD-N+100% RD-P + 100 % RD-K + Nano N + Nano Cu + Nano Zn followed by 100% RD-N +100% RD-P + 100 % RD-K + Nano N and 75% RD-N+100% RD-P + 100 % RD-K + Nano N + Nano Cu + Nano Zn recorded maximum growth and yield parameters. In contrast 50% RD-N + 100% RD-P + 100 % RD-K + Nano N showed increase in yield than the control (100% RDF (-N: -P: -K)(250:150:150kg/ha)) to conclude that Nano nitrogen could have compensated the 50% urea recommendation in conventional fertilizer and also had enhanced effect than control.

Keywords: Bioefficacy, nanonutrients, capsicum

INTRODUCTION

Vegetables are economic engines for productive, profitable agriculture economics. Its production provides a promising economic opportunity for reducing rural poverty and unemployment in developing countries and is a key component of farm diversification strategies (Schreinemachers et al., 2018). India is the second largest producer of vegetables in the world (surpassed only by China). Vegetables are the human race most accessible sources of vitamins and minerals for wholeness. This era trapper the need of vegetable production for economic and nutritional security and to achieve the millennium development goals in a timely fashion.

The genus Capsicum belongs to the family Solanaceae which is grown in several parts of the world and believed to be native of South America (Shoemaker and Teskey, 1995). Today, Capsicums are one of the preponderantly used of all natural remedies. Modern Mayan pharmacopoeia divulged that the tissues of capsicum are encompassed in a number of herbal remedies for a variety of malady of probable microbial origin (Cichewicz and Thorpe, 1996). Post-operative pain in mastectomy patients and ‘phantom limb’ pain in amputees are reduced by the use of a cream containing Capsaicin. Itching in dialysis patients and cluster headaches are also reduced by long term use of such creams (Carmichael, 1991).

However, India has many growing concerns. In the Indian economy the horticultural contribution to GDP has steadily declined while achieving enough food production, India still reports for a one fourth of the world’s hungry people and home to over million undernourished people. Indian horticulture feels the pain of fatigue of green revolution, the yield in many crops have been stagnated due to over use of fertilizers. Also low nutrient use efficiency due to leaching, declining soil organic matter, multi nutrient deficiencies, shrinking arable land, shortage of labor are results of evacuation of people from farming (Godfray et al., 2014).

The nutrient use efficiency of Nitrogen have reminded constant leaving a major amount of fertilizers to pile up in the soil or aquatic system that cause eutrophication. Thus to address these problems, the Nano based nutrients grabs the position which have a characteristic of small size and large surface area to volume ratio ,precisely detect and deliver correct quantity of nutrients required by the crop in suitable proportion that promote productivity and also ensure environmental safety (Carpenter et al., 1998).

When minimized to the nano scale, these nutrients show some characteristics that differ from the presence of the nutrients in the macro scale, allowing unique applications (Naderi and Danesh-Shahraki, 2013). Compared with chemical fertilizers, Nano-fertilizers has larger specific surface area, which makes nutrients more easily absorbed by plants, which significantly improves its fertilizer use efficiency and has significant economic benefits. The application of Nano-fertilizer can improve the physical and chemical properties of soil and improve the ability of water...
and fertilizer conservation (Yu ZQ, 2014). With the above background, the present study is initiated to know the Bio efficacy of Nano nutrients (Nano N, Nano Zn & Nano Cu) on growth and yield of capsicum with the following objectives:

- To study the effect of Nano N, Cu and Zn on crop yield
- To assess the economic feasibility of various treatments

**MATERIALS AND METHODS**

The current studies on Bio Efficacy of Nano Nutrients on growth and yield of Capsicum were carried out in a farmer’s field at Chinnapettai village in Panruti, Cuddalore district of Tamilnadu during 2019-2020. The details of materials used and the methods adopted during the course of investigation are presented below

**Geographical Location of the Experimental Field**

The experimental site is geographically situated at 11°.49’ North latitude and 76.97° East longitude at an average elevation of 23 meters above mean sea level in the Cuddalore district of Tamilnadu, India.

**Weather and Climate**

The weather of Panruti is moderately warm with hot summer. The maximum mean temperature of the location ranges from 20.6°C to 34. 4°C, while the minimum mean temperature ranges from 20°C to 27°C. The average Precipitation is about 1030.35 mm annually, of which 547.14 mm is received during North East monsoon (Oct-Dec), 340.04 mm is received during South West monsoon (June-Sept) and 143 mm is received as summer shower.

**Crop and Variety**

Bell pepper var. Priyanka 55 produced by United Genetics India Pvt. Ltd. was used in the study.

**Source of Nano Nutrients**

The Nano Nutrients such as Nano Nitrogen, Nano Zinc and Nano Copper used in this Study Were Obtained from IFFCO (Indian Farmers Fertiliser Cooperative Limited).

**METHODS**

**Crop management**

**Preparation of nursery and sowing of seeds**

Seeds of Capsicum var. Priyanka 55 were sown in the protrays (98 cells) at one seed per cell filled with coir pith. The seeded protrays were maintained in a HDPE green 50% shade net. Provision was also made to pull polythene sheet over the pro-trays in the event of rainfall by way of making low tunnel structure made of 3/4’’ LDPE pipes and 400 gauge UV stabilized polyethylene sheet.

**Preparation of main field and planting**

The main field was ploughed three to four times until fine tillth, after the first tillth Farm yard manure (1.5t) were applied. Paired rows were formed and drips was laid out and the spacing adopted was 90 x 60 x 60 cm in paired row system. 100-micron polythene sheets were used for mulching.

**Experimental Details**

Location : Chinnapettai, Panruti.

Number of Treatments : 10

Number of Replication : 3

Plot Size : 4 X 5 m²

Total number of plants : 1500 plants

Total number of plants per plot (20 m²) : 37 plants

Area : 18 cents

Spacing : 90X60X60 cm (Paired row system)

Variety : Priyanka 55
given at 30th and 60th days after transplanting alone and for 50% RDN: treatment nitrogen was given at 30th days after transplanting alone at 180 grams (urea) per plot per application as top dressing.

**Application of Nano Fertilizers**

Application of Nano Nutrients such as Nano Nitrogen, Nano Zinc and Nano Copper was done by Foliar application at three stages (Vegetative stage, flowering stage and fruiting stage). The Foliar application of Nano nutrients was given as per the treatments at the rate of 4ml per litre with power sprayer.

**Training**

The plants were trained by jute ropes tied to the horizontal gauge wire in the top. Training was done at 4 weeks after transplanting.

**Harvesting**

Harvesting was done 60 days after transplanting and when fruits show waxy coating and ideal size. Harvesting was done at 10 days' interval. The fruits harvested from tagged plants were used for taking yield parameters.

**Yield Parameters**

**Number of Fruits per plant**

The Number of Fruits harvested from randomly tagged five plants till final harvest was summed up and the mean was worked out and expressed in numbers.

**Fruit set Percentage**

The fruit set was worked out using the following formula and expressed in per cent.

\[
\text{Fruit set} = \frac{\text{Mean number of fruits plant}^{-1}}{\text{Mean number of flowers plant}^{-1} \times 100}
\]

**Fruit length and Fruit girth**

The length of fruit from the stalk end to the tip was measured using a metre scale and the mean expressed in centimetres.

The girth of fruit was measured using a thread and metre scale and the mean expressed in centimetres.

**Single Fruit weight**

The weight of individual fruit was recorded and the mean expressed in grams.

**Estimated yield hectare**

From the values of cumulative yield per plot, the yield per hectare was estimated and expressed in tonnes hectare\(^{-1}\) (t/ha\(^{-1}\)).

**Ascorbic acid**

The ascorbic acid content was estimated by Harris et al., (1933) and expressed as Milligram 100 gram\(^{-1}\) of fruit.

**COST ECONOMICS**

The cost economics of different treatments was worked out in order to compare the efficacy of the treatments and the benefit cost ratio was worked out as follows.

\[
\text{B : C ratio} = \frac{\text{Gross return / ha (Rs)}}{\text{Cost of cultivation / ha (Rs)}}
\]

**Statistical Analysis**

The data recorded were subjected to statistical analysis as per the method suggested by Panse and Sukhatme (1967). For significant results, the critical difference was worked out at 5 percent probability level by using DOS box AGDATA software.

### RESULTS

The data related to percentage fruit set, dry matter, number of fruits per plant, fruit length, fruit girth and single fruit weight is presented in the Table 1. The highest data was found in T\(_6\)-100% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn, T\(_7\)-75% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn followed and T\(_8\)-50% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn followed by T\(_3\)-100% RD-N +100% RD-P + 100 % RD-K Nano N, T\(_4\)-75% RD-N +100% RD-P + 100 % RD-K Nano N and T\(_5\)-50% RD-N+100% RD-P + 100 % RD-K Nano N which records on par values. The lowest data was found in T\(_2\)-0%N+100% RD-P + 100 % RD-K and slightly higher in T\(_1\)-100% RDF (-N: -P: -K) (250:150:150kg/ha).

Estimated yield ha⁻¹

The data pertaining to estimated yield ha⁻¹ is presented in the Table 2. The maximum yield ha⁻¹ was recorded in T₆ - 100% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn (19.685 t), T₇-75% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn (19.59 t) and T₈ 50% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn (19.56 t) followed by T₉-100% RD-N +100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn (19.38 t), T₅-75% RD-N +100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn (19.26 t) and T₄-50% RD-N +100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn (19.21 t) on par values. The minimum yield ha⁻¹ was recorded in T₁-0%N+100% RD-P + 100 % RD-K (14.45 t).

Ascorbic acid

In reference to the data presented in Table 2 on ascorbic acid by T₁-100% RD-N +100% RD-P + 100 % RD-K + Nano N (154.97 mg/100g), T₂-100% RD-N +100% RD-P + 100 % RD-K + Nano N (155 mg/100g) and T₃-50% RD-N +100% RD-P + 100 % RD-K + Nano N (155.54 mg/100g), which recorded on par values. The least recorded ascorbic acid content was found in T₂-0%N+100% RD-P + 100 % RD-K (125.25mg/100g).

Cost Economics

The data related to cost economies on Bio efficacy of Nano nutrients on capsicum is presented in the Table 3.

Among the Nano nutrients, the return per rupee invested was in the treatment T₅-50% RD-N+100% RD-P + 100 % RD-K Nano N (2.27) and T₇-50% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu (2.26). The lowest return per rupee invested was observed in T₂-0%N+100% RD-P + 100 % RD-K (1.6).

Discussion

The results showed 21.6 % increase in fruit length than control. The result is similar to the finding of (Davarpanah et al., 2017) in pomegranate using Nano Nitrogen.
Bioefficacy of nano nutrients (N, Zn & Cu) on yield of capsicum

Among the ten treatments maximum fruit Physical parameter is recorded in treatment T_6-100% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn, T_7-75% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn and T_8-50% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn showed coequality regarding fruit girth followed by T_3-(100% RD-N +100% RD-P + 100 % RD-K + Nano N) with, T_4 -75% RD-N +100% RD-P + 100 % RD-K + Nano N and T_5-50% RD-N +100% RD-P + 100 % RD-K + Nano N which also recorded on par values. The minimum fruit girth was recorded in treatment T_2 - 0% N+100% RD-P + 100 % RD-K (14.2 cm). Also it is evident that Nitrogen deficiency in leads to growth limitation in all plant organs, including roots, stems, leaves, flowers, and fruits (Barker and Pilbeam, 2007). The result is in close agreement with (Osama et al., 2015) in Mango. Improvements in fruit physical parameters after N application may be due to increases in the efficiency of metabolic processes, since N is a constituent of proteins, enzymes, and chlorophyll related to photosynthesis and growth. The developing fruit acts as a strong sink and it is well known that during fruit cell division, high amounts of C and N in the fruitlet tissues are needed for rapid cell division (Cheng et al., 2007; Xia et al., 2009).

The reason for increased fruit weight is increase nitrogen uptake and abortion by the plant which indirectly increase the fruit weight as the Nitrogen plays a chief role in source and sink development and protein synthesis (Sharma et al., 2014).

The yield increase is due to combined effect of Nano Nitrogen, Nano zinc and Nano copper. foliar application of Nano nitrogen increased the absorption capacity and absorbed nitrogen in leaf (source) directly influenced the sink (fruit). Also at certain point the excess Nitrogen cannot ensure a significant increase in crop productivity, yet its abundant application can induce a decrease in crop yield and cause environmental damage thus in T_2-100% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn, T_3-75% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn, T_4-50% RD-N+100% RD-P + 100 % RD-K Nano N + Nano Cu + Nano Zn treatments recorded on par values.

The increase in ascorbic acid might be due to enhanced enzymatic activity of ascorbic acid oxidase, as Cu is also involved in carbohydrate metabolism wherein positive and close relationship with formation of ascorbic acid exists. The pronounced effect of Cu in increasing the ascorbic acid and other quality traits could be attributed to the effect of Cu in promoting the absorption of other nutrients and Zn to a considerable degree as evidenced by the positive correlation between Cu and these elements.
